BugBoard: A Centralized Dashboard for Bug Bounty Hunters & Security Researchers

#bugboard #yogsec #cybersecurity #bughunter

Bug bounty hunting is not just about knowing vulnerabilities - it's about **workflow efficiency, speed, and clarity**.

If you're a bug bounty hunter or security researcher, you already know the pain:

- Too many tools
- Too many terminals
- Too many browser tabs
- Notes scattered everywhere

Over time, this chaos slows down recon, testing, and reporting.

That frustration is exactly what led me to build **BugBoard**.

What is BugBoard?

BugBoard is an **open-source, web-based bug hunter dashboard** designed to help security researchers and bug bounty hunters **find vulnerabilities faster** by bringing tools, automation, and structured workflows into one clean interface.

Instead of manually running dozens of commands and switching contexts, BugBoard acts as a **single control panel** for reconnaissance, scanning, and vulnerability testing.

Live Demo: <https://yogsec.github.io/BugBoard>

Why BugBoard Exists

During real-world bug bounty work, I noticed a pattern:

- Recon tools are powerful but fragmented
- Beginners struggle to understand *which tool to use and when*
- Experienced hunters waste time repeating the same steps

BugBoard solves this by:

BugBoard Frontpage Overview

When you open BugBoard, you’re greeted with a clean and intuitive dashboard:

- A **target input field** where you enter the domain
- Category-based navigation tabs
- Tool-specific documentation built directly into the interface

Each tool page doesn’t just run a command — it explains:

- What the tool does
- Why it’s useful
- When to use it during a bug bounty workflow

This makes BugBoard extremely beginner-friendly while still powerful for advanced users.

Structured Testing Categories

BugBoard organizes security testing into logical categories, inspired by real pentesting and bug bounty methodologies:

- **Wildcard & Domain Recon**
- **Information Gathering**
- **Configuration Issues**
- **Authentication & Authorization**
- **Session Management**
- **Validation & Input Handling**
- **Business Logic**
- **Cryptography**
- **DoS & Risk Functionality**
- **HTML5 & Modern Web Issues**

This structure helps hunters follow a **methodical approach** instead of random testing.

Integrated Recon & Security Tools

One of BugBoard’s biggest strengths is its **tool integration philosophy**.

Instead of reinventing the wheel, BugBoard integrates well-known and trusted tools such as:

- **amass** – Subdomain enumeration & attack surface mapping
- **subfinder** – Fast passive subdomain discovery
- **assetfinder** – Asset discovery
- **dnsgen / massdns** – DNS permutation & resolution
- **httpx / httpprobe** – HTTP service discovery
- **gau / waybackurls** – Historical endpoint discovery
- **hakrawler / katana** – Crawling
- **nuclei** – Template-based vulnerability scanning
- **nikto** – Web server misconfiguration checks
- **ssllscan / sslx** – TLS & SSL analysis
- **subjack** – Subdomain takeover detection

Each tool is placed **where it logically belongs** in the testing lifecycle.

Example: amass Tool Inside BugBoard

Inside BugBoard, tools like **amass** are not just buttons.

The dashboard explains:

Kindness is contagious

Okay

New researchers learn *why* they are running something — not just *how*.

Automation Without Losing Control

Automation is powerful — but blind automation can miss context.

BugBoard takes a **controlled automation** approach:

- Automates repetitive tasks
- Keeps results visible and understandable
- Allows manual testing at every stage

You decide when to:

- Scan
- Enumerate
- Dig deeper

BugBoard assists — it doesn't replace human thinking.

Embedded Terminal Experience

BugBoard includes an **embedded terminal interface**, allowing users to:

- Run custom commands
- Chain tools together
- Experiment without leaving the dashboard

This is especially useful for advanced hunters who already have their own workflows but want a centralized UI.

Who is BugBoard For?

BugBoard is built for:

- **Bug bounty hunters**
- **Security researchers**
- **Pentesters**
- **Students learning web security**
- **Small security teams**

Whether you're just starting out or already hunting on platforms like HackerOne and Bugcrowd, BugBoard adapts to your level.

BugBoard Pro (Future Vision)

BugBoard also has a **Pro Edition roadmap**, aimed at:

- Advanced automation
- Extended integrations
- Premium support
- Team-based workflows

If you're interested in the Pro version, you can reach out directly.

♥ Open Source & Community Driven

BugBoard is **fully open-source** because security tools should be transparent.

Try BugBoard Today

Live Demo: <https://yogsec.github.io/BugBoard>

GitHub Repository: <https://github.com/yogsec/BugBoard>

If you find BugBoard useful:

- ★ Star the repo
- Open issues
- Share with other hunters

Final Thoughts

Bug bounty success is not just about skill — it’s about **systems**.

BugBoard is my attempt to build a system that:

- Reduces noise
- Improves focus
- Helps hunters think clearly

If BugBoard helps you find even one bug faster — it has done its job.

Happy hunting
